FortiSwitch Cloud

FortiSwitch Cloud offers management capabilities that scale from individual businesses managing several hundred ports to Managed Service Providers managing several thousand. With a zero-touch deployment, FortiSwitch Cloud eliminates the need for onsite technical expertise. A cloud license key is shipped with each FortiSwitch unit. Add that key to your account, provide power and connectivity and you are able to provision your FortiSwitch. Administrators can remotely configure ports and VLANs and make individual or system wide changes with a few clicks of a mouse. Once configured, monitoring tools help assess the health of the network. If problems arise, troubleshooting commands can be run remotely, and audit logs track system and configuration changes. As your network runs, you are able to spot trends and optimize your environment.
